

# Manage Social Anxiety with PISTA

SWIPE

**PISTA utilizes deep brain stimulation to manage behavioral problems, such as fear of managing social situations.**

The stimulation is done by using a combination of sound and vibration using the PISTA device.

This helps to reduce fear and anxiety associated with social situations by retraining the brain to respond differently when the patient is in a social situation.

This helps to reduce fear and anxiety associated with social situations by retraining the brain to respond differently when the patient is in a social situation.
